February 22, 2018

Let ν be a complex variable on the plane. Let τ be a complex variable on the upper half plane. Let $\theta(\nu)$ be an arbitrary ¹ entire function satisfying

$$heta\left(
u+1
ight)=- heta\left(
u
ight)$$
 and $heta\left(
u+ au
ight)=-q^{-1}z^{-2} heta\left(
u
ight),$

provided that $\theta(\nu)$ does not vanish identically, where $z := e^{i\pi\nu}$ and $q := e^{i\pi\tau}$.

 1. This function is defined up to a scalar.
 (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□

The meromorphic function

$$J(
u) := rac{ heta'(0)}{2\pi i heta(
u)}$$

is well-defined.

Camille Jordan proved the following identity

$$J(\nu) = \frac{1}{z - z^{-1}} + \sum_{m \ge 1} \sum_{n \ge 1} q^{2mn} \left(z^{2m-n} - z^{-2m+n} \right).$$

イロト イポト イヨト イヨト

Э

SQC

We will use the notation $T_{\ell}(z)$ for the coefficient of q^{ℓ} in the expansion of $J(\nu)$. For each even integer $\ell \geq 2$,

$$T_{\ell}(z) = \sum_{\substack{(m,n) \in (\mathbb{Z} \ge 1)^2 \\ 2mn = \ell}} (z^{2m-n} - z^{-2m+n}).$$

The coefficients of $T_{2n}(z)$, for $n \ge 1$, belong to the set $\{+1, 0, -1\}$.

イロト 人間ト イヨト イヨト

-

In 2011, Tamás Hausel, Emmanuel Letellier and Fernando Rodriguez-Villegas showed a link between the Laurent polynomials² $T_{\ell}(z)$ and the Hodge structure of the Hilbert scheme of *n* points on $\mathbb{C}^{\times} \times \mathbb{C}^{\times}$.

In 2015, Christian Kassel and Christophe Reutenauer showed a link among the Laurent polynomials $T_{\ell}(z)$, the ideals of the algebra $\mathbb{F}_q[x, y, x^{-1}, y^{-1}]$ and the subgroups of $\mathbb{Z} \times \mathbb{Z}$.

2. The original version was rather different, but equivalent to this one.

Let $n \ge 1$ be an integer. Denote D_n the set of divisors of n. Define $2D_n := \{2d : d \in D_n\}$. Let $\tau_1 < \tau_2 < ... < \tau_k$ be the elements of the symmetric difference $D_n \triangle 2D_n$ written in increasing order. The coefficients of $T_{2n}(z)$ are essentially codified by the word

$$\delta(n)=t_1\,t_2\ldots t_k,$$

where

$$t_i := \begin{cases} (, & \text{if } \tau_i \in D_n \setminus (2D_n), \\), & \text{if } \tau_i \in (2D_n) \setminus D_n. \end{cases}$$

・ロト ・ 同ト ・ ヨト ・ ヨト ・ ヨ

~ ~ ~ ~

For any $n \ge 1$, the word $\delta(n)$ is a sequence of balanced parentheses, i.e. the word $\delta(n)$ determines a Dyck path.

Definition

Let Σ be a finite alphabet. Given a set $S \subseteq \mathbb{Z}_{\geq 1}$, we say that S is *rational* (*context-free*) with respect to a function $f : \mathbb{Z}_{>1} \longrightarrow \Sigma^*$, if

$$S=f^{-1}(L)$$

for some rational (context-free) language $L \subseteq \Sigma^*$.

- (目) - (日) - (日)

Theorem (J. M. R. C., 2017)

The following sets are rational with respect to δ ,

- (i) the empty set of integers,
- (ii) all the integers,
- (iii) powers of 2,

(iv) semi-perimeters^a of Pythagorean triangles.

a. The semi-perimeter is a half of the perimeter.

Theorem (J. M. R. C., 2017)

The following sets are context-free with respect to δ ,

(i) integer having exactly k blocks, for any fixed k ≥ 1,
(ii) numbers n satisfying F(n) ≥ h, for any fixed integer h ≥ 1,

where F(n) is the Erdös-Nicolas function^a, i.e.

$$F(n) := \max_{t>0} \# \{ d | n : t < d \le 2t \}.$$

We define the Hirschhorn function³, $H : \mathbb{Z}_{\geq 1} \times \{0, 1\} \longrightarrow \mathbb{Z}_{\geq 0}$ by means of the expression

$$\mathsf{H}(n,b) := \# \left\{ (a,k) \in \Pi_n : k \equiv b \pmod{2} \right\},\$$

where Π_n is the set of pairs $(a, k) \in (\mathbb{Z}_{\geq 1})^2$ such that

$$n = a + (a + 1) + (a + 2) + ... + (a + k - 1).$$

3. M. D. Hirschhorn and P. M. Hirschhorn. "Partitions into consecutive parts." (2009).

Theorem (J. M. R. C., 2017)

Given $k \in \mathbb{Z}_{\geq 0}$ and $b \in \{0, 1\}$, the set of integers $n \geq 1$ satisfying $H(n, b) \geq k$ is rational with respect to $\hat{\delta}$.

・ 一 ト ・ 三 ト ・

Given $n \ge 1$ and d|n, we say that d is a middle divisor of n if

$$\sqrt{\frac{n}{2}} < d \le \sqrt{2n}.$$

Theorem (J. M. R. C., 2017)

For each integer $k \ge 1$, the set of numbers n having exactly k middle divisors is context-free with respect to $\hat{\delta}$.

< 同 > < 回 > < 回 >

We says that *n* is *odd-trapezoidal* if H(n, 0) = 0.

Theorem (J. M. R. C., 2017)

For all integers $n \ge 2$, if n is not a power of 2 and n is odd-trapezoidal, then 2n is the perimeter of a Pythagorean triangle.

- 4 周 ト 4 月 ト 4 月

Theorem (J. M. R. C., 2017)

For all integers $n \ge 1$, if 2n is the perimeter of a Pythagorean triangle, then n has at least two different prime divisors.

- 4 同 ト 4 目 ト 4 目

We say that *n* is 2-densely divisible⁴ if *n* has only one block.

Theorem (J. M. R. C., 2017)

For all integers $n \ge 2$, if n is 2-densely divisible and 2n is not the perimeter of a Pythagorean triangle then n is a power of 2.

4. Densely divisible numbers were introduced by the international team *po-lymath8*, led by Terence Tao, in order to improve Zhang's bound for the gap between consecutive primes.

José Manuel Rodríguez Caballero

The following result is Theorem 3 in Hartmut F. W. Höft, *On the Symmetric Spectrum of Odd Divisors of a Number*, preprint on-line available at https://oeis.org/A241561/a241561.pdf

Theorem (Höft, 2015)

For all $n \ge 1$, there exists at least a middle divisor of n if and only if the number of blocks of n is odd.

< □ > < □ > < □ >

A formal language is *decidable* if there exists a total Turing machine ⁵ that, when given a finite sequence of symbols as input, accepts it if it belongs to the language and rejects it otherwise.

Is the language $\delta(\mathbb{Z}_{\geq 1})$ decidable?

Recently I found some connections between the coefficients of $T_{\ell}(-z)$ and the lengths of the hypotenuses of primitive Pythagorean triangles ⁶.

It seem that there is an arithmetical theory for the words encoding the coefficients of $T_{\ell}(-z)$.

^{6.} Pythagorean triangles for which the length of sides are relative primes. E

- (i) To formalize this theory as a library in the proof assistant Coq.
- (ii) To combine Coq with artificial intelligence in order to obtain "interesting" theorems⁷ in an autonomous way, e.g., using genetic algorithms or neuronal networks.
- (iii) To check whether or not the theorems obtained by the computer are essentially the same as the theorems showed in this talk.
- (iv) Next time my computer will give my talk.
